Description

The purpose of this adapter is simplifying connection of 24 and 25 series memory chips in different packages to any programmer (cheap CH341 is mostly used) with standard 8-pin cable.

DIP chips can be just connected to sockets and surface packages can be soldered as well as just pressed to PCB while being programmed.

Built-in 2-ways level shifter makes it possible to program chips with both 3.3v and 1.8v levels (jumper selection).

The second PCB on cable has DIP8-like connector making it possible to connect cable to any programmer with ZIF or DIP socket. The cable will be sent along with adapter.

Attention!: programmer is not included! Pictures with CH341 programmer in description are obliged to show the example of connection.
